Subject: RE: PFAS Sampling Updates

I have reviewed the study plan and my only question/comment is will sampling will be conducted during dry weather only when the flows in the river are relatively constant. I don't feel it is appropriate to sample during rainfall events, even if the flows are around the monthly average of 450 cfs . To determine loads, flow measurements will need to be taken at each sampling site and I would assume you would want the flows measured throughout the system to be relatively constant, not on a rising or falling limb or a hydrograph.

Thanks Liz

Hello Jac,

Attached for your review is the proposed sampling for PFAS in the Chattooga River Watershed, to be conducted the week of November 4th. This date is contingent on base-flow conditions in the river. Please let me know if you have any comments on this proposed plan or if you, or anyone from your staff, would like to discuss it. Thank you for providing any potential input by October 18th.

Brian Smith, P.E.

Subject: FW: PFAS Sampling Updates

Good afternoon Jac,

In the spring of this year, we provided an opportunity for your review and input on a sampling effort to assess PFAS contributions from various streams into Weiss Lake. With this email I am transmitted the final report containing the results of that study. This study evaluated the PFAS mass loading rates of 11 Alabama and 6 Georgia inflowing tributaries into Weiss Lake and investigated the vertical profiles of PFAS at two locations in Weiss Lake. Please feel free to let me know if you have any questions or concerns about the findings of this report.

As a result of this study, the EPA intends to follow-up on our commitment to sample the highest PFAS contributing streams to assess likely sources including measurement sediment PFAS levels. The EPA will conduct follow-up sampling along the Upper Coosa River Basin (Conasauga, Oostanaula and Coosa Rivers) and along the Chattooga River. Also attached for your review is the sampling plan for the Upper Coosa River Basin. The field activities for this study targeting base flow conditions are planned for next week, beginning on September 16th (with a weather contingency week of October 7th, if base flows are not present). The goal of this proposed study is to determine the presence of PFAS compounds in 8 co-located surface water and sediment samples, along with assessing the potential for resuspension of sediments, in the Upper Coosa River Basin. Due to proximity of the start of field activities for this study, we are requesting comments by **Friday, September 13th**. We will share a similar plan for sampling along the Chattooga as soon as it is prepared. We intend to conduct the sampling along the Chattooga this Fall.

Please do not hesitate to contact me, if you have any questions.

Brian Smith, P.E.
